## Some structural features of consumer price index in the Republic of Moldova, core inflation methodology adopted at the end of 2009 and the changes made and approved in the annex of the respective methodology at the beginning of 2012

Technical box extracted from:

[Inflation Report no.2, May 2012](#) <sup>(1)</sup>

According to Article 4 of the Law on the National Bank of Moldova of 2006, the NBM's fundamental objective is to achieve and maintain price stability. The evolution of prices of goods and services is reflected by several statistical indicators such as CPI, industrial production price index, GDP deflator, etc.

**Consumer price index (CPI)** - is an evaluation indicator, which characterizes and provides an estimate of the overall development of prices for purchased goods and tariffs for services used by people to meet the needs of living in a certain period to a fixed period.

At the end of 2009, to facilitate the achievement of the fundamental objective of the National Bank of Moldova to ensure and maintain price stability, but also to learn more about the inflationary processes in the national economy, together with the NBS, the NBM developed and approved the Methodology for calculating the core inflation index. This methodology will contribute to the perception and pursuit of the NBM monetary policy actions by the general public in the context of transition to a new central bank monetary policy regime.

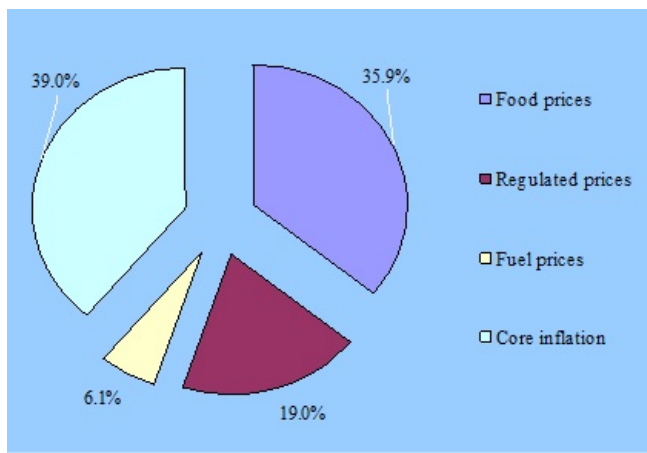

**Core inflation index** is the measurement reflecting persistent sources of inflationary pressures, which allows perceiving the inflation trend in case the effects of temporary and transitory influences are eliminated. The calculation of this index, according to this methodology, is performed by removing from the overall inflation the effects of some transient shocks such as the modifications from price and tariff changes of goods and services with regulated prices, adverse weather conditions affecting food supply, changes of price of some products and seasonal variations in international prices for fuels.

As a result, Consumer Price Index is divided into four general components, whose development allows identifying more clearly the origin of shocks affecting the inflation: **core inflation, food prices, regulated prices and fuel prices**. The weight of these components in 2011 is reflected in the Chart no.1.

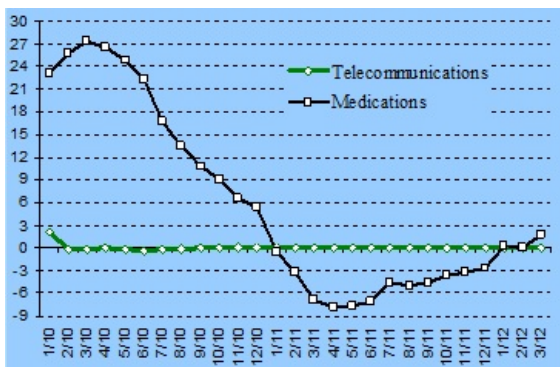

However, prices of some components (telecommunications, medications) with significant shares (5.1% and 4.8%, respectively), originally assigned to core inflation, showed a trend which didn't vary depending on the ratio between supply and demand (Chart no.3), but were subject to regulation by the central authorities. Therefore, the prices of these subcomponents usually do not depend on aggregate demand and cannot be influenced by monetary policy actions.

**Chart no.1. CPI structure with medications and telecommunications prices included in core inflation**

**Chart no.2. CPI structure with medications and telecommunications prices included in regular prices**

**Chart no.3 Evolution of medications and telecommunications prices**

**Chart no.4 The impact of the exclusion of medicaments and telecommunications prices from core inflation**

Mai mult, stabilitatea îndelungată a prețurilor la telecomunicații, dar și diminuarea prețurilor la medicamente din anul precedent au avut un impact semnificativ de diminuare a inflației de bază fapt ce este reflectat în graficul nr. 4 și, în acest fel, acestea au distorsionat, într-o anumită măsură, mărimea presiunilor inflaționiste existente în economie datorită excesului de cerere.

În acest sens, pentru a avea un indicator ce ar corespunde realității și în baza cărora ar putea fi formulate concluzii și recomandări obiective cu privire la măsurile de politică monetară, care ar fi necesare și suficiente pentru a orienta cererea agregată către nivelul său de echilibru, a fost necesar de a efectua modificări în metodologia de calcul a inflației de bază din anul 2009 prin includerea prețurilor la serviciile de telecomunicații și medicamente în componentul servicii reglementate. În rezultatul schimbărilor efectuate în luna ianuarie 2012, ponderea prețurilor reglementate s-a majorat cu cca. 10 p.p. din contul sub-componentului inflația de bază, în timp ce cea a prețurilor alimentare și a prețurilor la combustibil a rămas aceeași (graficul nr. 2). În acest fel, traiectoriile inflației de bază și a prețurilor reglementate din ediția curentă a Raportului Inflației reflectă schimbările sus-menționate și sânt diferite de cele din edițiile anterioare ale Raportului Inflației pentru perioada de până la finele anului 2011.
