## Monetary policy decision, 03.06.2022

NBM Governor Octavian Armașu presents the Monetary Policy Decision

**The Executive Board of the National Bank of Moldova, at its meeting of 3 June 2022, adopted by unanimous vote the following decision:**

1. **To set the base rate applied to major short-term monetary policy operations at 18.50% annually.**
2. **To set interest rates:**
  - a) **on overnight loans at 20.50% annually;**
  - b) **on overnight deposits at 16.50% annually.**
3. **To increase the required reserves ratio from the financial means attracted in Moldovan lei and in non-convertible currency, as follows:**
  - a) **starting with the period of application of the required reserves in MDL: 16 June 2022 – 15 July 2022, from 30.0% to 32.0% of the calculation base.**
  - b) **starting with the period of application of the required reserves in MDL: 16 July 2022 – 15 August 2022, from 32.0% to 34.0% of the calculation base**
4. **To increase the required reserves ratio from the financial means attracted in freely convertible currency, as follows:**
  - a) **starting with the period of application of the required reserves in freely convertible currency: 16 June 2022 – 15 July 2022, from 33.0% to 36.0% of the calculation base.**
  - b) **starting with the period of application of the required reserves in freely convertible currency: 16 July 2022 – 15 August 2022, from 36.0% to 39.0% of the calculation base.**

The risks and uncertainties regarding the stability of consumer prices are major, which has determined the maintenance of the restrictive monetary policy stance. Furthermore, monetary policy measures are appropriate from several

perspectives. These are related to moderating the second-round effects of external price shocks, balancing aggregate demand, stimulating savings over immediate consumption and easing pressures on the depreciation of the national currency due to rising current account deficit and capital outflow.

The monetary policy promoted by the NBM creates monetary conditions that can alleviate the alert growth rates of consumer prices and side effects of supply shocks. Thus, the NBM aims to anchor inflation expectations and bring inflation back within the range of  $\pm 1.5$  percentage points from the medium-term inflation target of 5.0%.

Regional and global economic conditions remain affected by the tense situation due to the war in Ukraine, and the associated risks and uncertainties, respectively. Inflation has risen globally at an accelerated pace, driven by continued growth in quotations on international markets for raw materials, food, and energy resources, along with disruptions in supply, production, and transportation chains.

Under these circumstances, central banks revised upwards their inflation forecasts for the coming quarters and, in response, maintained an anti-inflationary monetary policy. The regional and international context unbalances the domestic macroeconomic situation and puts pressure on inflation through the import channel. Compared to other states, the Republic of Moldova has an increased dependence on quotations and developments on international markets, which makes our country even more vulnerable to price shocks.

Evolution of inflation. The annual inflation rate rose from 22.2% in March to 27.1% in April 2022 due to overlapping factors. In addition to the import component of the inflationary process, an important factor that amplified inflation is the delay in adjusting regulated tariffs. The negative deviation of 0.3 percentage points in actual inflation from the forecast for April of this year, together with the delay in some rate adjustments and anticipated side effects, implies the probability of a downward deviation of the inflation forecast for the second quarter of 2022. At the same time, the tense situation in the region and the risks of its escalation maintain the uncertainty over the medium-term inflation forecast.

The factors that will determine the dynamics of inflation in the future will continue to be import prices for energy resources and food. The latter will possibly replace goods from Ukraine, and the respective pro-inflationary effects will activate supply factors through production costs.

Economic activity. Operational statistics published after the forecast round contained in the Inflation Report, May 2022, show conditions for positive economic growth in the first quarter of this year, but sharply attenuated compared to the previous quarter.

The medium-term outlook for GDP developments depends on the course of the war in Ukraine, and risks and uncertainties involved. In this sense, one can identify factors likely to affect the consumption of the population. On the one hand, there is a pro-inflationary impact from refugee demand and, on the other hand, a disinflationary impact from the perspective of mitigating the sources of consumption financing related to the contraction of remittances. Amid disruptions in supply chains and logistics of foreign trade, the trend of product substitution and restructuring of economic sectors persists. Due to the increase in the cost of mineral fertilizers and energy resources, farmers must bear high costs, which set conditions for lower agricultural activity this year and maintenance of high levels of food prices.

Monetary conditions, adjusted by the restrictive monetary policy promoted, remain favourable to support savings, attractiveness of deposits and, at the same time, attenuation of population's consumption, as well as consumer credit which warms the economy and fuels pro-inflationary pressures.

Recent analyses show an increase in interest rates on new loans in national currency and, respectively, a moderation in lending rates, weakening the pressures on the inflationary process. Although the rates on new deposits attracted in national currency continue the upward trend, depositors are reluctant amid uncertainties about the developments in the armed conflict in the neighbouring country. However, the weekly data signal the trend of a rising volume of new deposits attracted in Moldovan lei, after its decrease in March of this year.

Global, regional, and national risks and uncertainties are amplified by the repercussions of the military conflict in Ukraine, and the outlook for economic conditions in the context of these events is precarious. The analysis and evaluation

of the available macroeconomic information, after the elaboration of the forecast round in April 2022, signalled the persistence of a risk of upward deviation from the medium-term inflation forecast for the entire forecast horizon, except for the second quarter of this year.

The estimation of the deviation risk is based on external assumptions associated with lower global economic activity and higher international oil and food prices compared to the expectations in the Inflation Report, May 2022. In addition, the risks from the internal environment, related to the possible actions of authorities to support the population and economic operators in the following periods, as well as the adjustment of the regulated tariffs, will have a pro-inflationary influence.

Subsequent decisions of the Executive Board will depend on the dynamics and medium-term outlook for inflation, while monitoring and assessing risks from the internal and external environment. At the same time, the NBM reiterates the need for coordination and interaction of monetary and fiscal measures to maximize their effects on the real economy and inflation.

The next meeting of the Executive Board of the NBM on the promotion of monetary policy will take place on 8 August 2022, according to the approved schedule.
